Ceballos Cauich Julio Elías

IATools

Producing a UI with AI was quite simple as it greatly facilitated the information synthesis process. The AI transformed the data we provided from people into a single person and based it on which it generated a functional UI design.

Regarding the final result, the AI-generated UI does include several usability aspects, such as a clear visual hierarchy and accessible buttons. However, certain details more specific to the context of the user requirements established by the teacher had to be corrected.

I believe that with the development of AI tools, it will greatly influence the role of user experience, but it won't eventually disappear. AI can automate repetitive tasks and generate design proposals, but someone is still needed to evaluate, adjust, and validate the solutions so that they truly adapt to the requirements.
